EXECUTIVE SUMMARY

The objective of this study is to describe the economic base of the Coastal Bend Workforce Development Area and to identify the leading industry clusters that will help drive future employment growth in the region. Basic techniques of economic base analysis, including location quotients and shift-share ratios, are applied to historical and projected employment data over the 2003-2018 period. Some industries that demonstrate regional economic strengths and growth potentials are aggregated to form clusters. For each of the five identified clusters, this report lists its major employers, occupations and wage earnings. This report also contains a synopsis of the identified clusters’ strengths and weaknesses as targets for future development.

- The economic base of the Coastal Bend region is represented by a well-balanced mix of industries. As in the nation as a whole, employment in the region has shifted from manufacturing-oriented to service-oriented industries. Regional employment growth since 2003 has followed more the relatively faster pace of the Texas state than of the U.S. as a whole.

- A diverse mix of industry clusters contributes to the Coastal Bend economy—construction, energy, education, healthcare and tourism. Together, these five clusters account for nearly half of regional total employment. The largest clusters are healthcare, education and tourism, each of which shares a roughly 10 percent of the regional workforce.

- The five industry clusters accounted for 45 percent of total employment in the Coastal Bend WDA during 2008. Between 2008 and 2018, these clusters are expected to gain a total of 26,000 jobs, or approximately 60 percent of the projected total employment growth in the region. Some industries in the energy cluster, including oil and gas extraction, are expected to experience protracted declines in employment.

- The five industry clusters together account for approximately 40 percent of all private firms in the Coastal Bend WDA. Employers in those clusters also yield a wide variety of occupations, some of which pay the highest (oil and gas extraction) wages and salaries in the area while others pay the lowest (restaurants). Overall, the typical wage rate of those clusters together is higher than the average wage rate in the region.
I. INTRODUCTION

This report presents the economic base analysis for the Coastal Bend Workforce Development Area (WDA). The region has some comparative advantages that are responsible for the growth of certain industries and their industrial make-up. Those industries form the regional economic base, which generates the largest amount of income and employment in excess of the demand within the regional community. Knowledge about the economic activities that are key drivers of the regional economy is helpful for economic and workforce development. This study is commissioned by the Workforce Solutions of the Coastal Bend. As an update to an earlier economic basic analysis for the Area by Lee (2004), this report provides an understanding of the extent to which the regional economic base has evolved in recent years and how the regional economy will potentially evolve in the next decade.

Objective

The objective of this report is to document the major findings of an economic base analysis for the Coastal Bend WDA using both recently available and projected data. The analysis draws on an approach commonly referred to as industry cluster analysis, which identifies groups of industries that comprise the Area’s economic base as the cornerstone of the regional economy.

Why is industry cluster analysis important? Industry clusters have been recognized as critical elements that determine the competitiveness of a region in the global marketplace (Porter 1990). As the key drivers of economic growth, industry clusters have increasingly been incorporated into regional policy strategies for workforce and economic development. Some notable clusters are in Silicon Valley for its microelectronics and information technology industries; and the Research Triangle in North Carolina for its agricultural, pharmaceutical and telecommunications industries.

Industry clusters are the “engines” of an economy, driving its growth in the long run. As such, an understanding of their recent and future trends as well as their strengths and weaknesses is an important first step toward building a successful regional economic development strategy. In 2004, Texas Governor Rick Perry officially adopted a strategic plan that targets the development of several industry clusters (Perry 2004).

Data Sources

For planning purposes, employment and wage data are the key components of this study. The primary sources for the regional- and state-level data are Texas Workforce Commission’s online databases: SOCRATES, TRACER, and Wage
Information Network (WIN). The U.S. Census Bureau, the Bureau of Labor Statistics and the Bureau of Economic Analysis provide other economic data, particularly those at the national level. Industries are classified using the industry definitions of North American Industry Classification System (NAICS) wherever possible.

One distinctive aspect of the industry cluster analysis in this study is the use of future projected data, rather than historical data. While historical data help identify industries that have flourished or declined, future data projections are more instrumental for workforce development and economic planning. The TRACER database contains current industry and occupational employment estimates for both the Coastal Bend WDA and the state of Texas, as well as projected data through 2016. In this study, data projections for the period through 2018 are performed using interpolations of the data from TRACER and other sources.

The benchmark period of this study is Year 2008. Data in 2009 are omitted intentionally for the following reason: The national economy has suffered the most severe recession since the Great Depression. In 2009, employment particularly at the national level dropped substantially. The U.S. unemployment rate was 9.3 percent in 2009, as compared to 5.8 percent a year earlier. By early 2010, the labor market had shown signs of recovery. However, the economy in the Coastal Bend WDA was relatively more stable. The disparity between the local economy and the national business cycle in 2009 can lead to bias in an economic base analysis that relies on comparing local data with national or state data (Froeschle 2005). Because data in 2009 are not representative of long-term economic trends, they are ignored in this study.

Area Profile

Geographical Definition

The Coastal Bend WDA consists of 12 counties in South Texas: Aransas, Bee, Brooks, Duval, Jim Wells, Kenedy, Kleberg, Live Oak, McMullen, Nueces, Refugio, and San Patricio (see Exhibit 1). The counties of Aransas, Nueces and San Patricio comprise the Corpus Christi Metropolitan Statistical Area (MSA). The Port of Corpus Christi, the fourth largest port in the U.S. by cargo tonnage, supports shipping and offshore oil and gas drilling on the Gulf of Mexico.
Exhibit 1
Counties of the Coastal Bend WDA.
Regional Economic Profile

The 12 counties of the Coastal Bend WDA have a total population of about 560,000 (see Exhibit 2). The Corpus Christi MSA is the largest populated area in the Coastal Bend WDA and has a population of about 415,300, or 75 percent of the regional total. Between 2003 and 2008, the population in the region grew at an average annual rate of 0.5 percent, which was remarkably lower than the Texas state average of 2 percent and the national average of 0.9 percent. According to the Census Bureau, the regional population is projected to grow through 2020 at about the same pace as in the past decade.

As in most parts of Texas, economic growth in the Coastal Bend WDA accelerated in recent years. Between 2003 and 2008, the area’s gross domestic product in current dollars—the broadest measure of the size of an economy—grew at 9 percent per year on average, which was appreciably higher than the national average of 6 percent. In real terms, output grew at an annual rate of over about 5 percent, which was still significantly higher the growth rate of about 2 percent in the observation period of the previous study (1990-2002).

Economic activity is the driving force for job creations and household earnings. During the 2003-2008 period, the area witnessed an annual average of 1.6 percent in employment growth, which was higher than the national average of 1 percent but was on a par with the statewide average. Because of the accelerated job growth in the Area, the regional unemployment rate has shown a sustainable decline. By 2008, unemployment in the Coastal Bend WDA was 4.7 percent, which was lower than the average unemployment rates of both the nation and the state for the first time since official data became available in 1979.

Despite its relatively higher job and income growth, the Area’s personal income per capita of $31,492 in 2008 remained lower than the national and state averages. The relatively low income level was attributable to the relatively slow growth in wage earnings. In 2008, the average hourly wage rate for the Area was $16.2, which was at least $2 below the corresponding rate of $20.32 nationwide or $18.90 statewide.

The relatively low wages and income earnings for workers in the Coastal Bend WDA can be explained by educational attainment. Educational attainment is an indicator of workforce preparedness and thus workers’ earning potentials. As shown in Exhibit 2, the share of the regional population with either a high-school diploma or a college degree lags behind the rest of the nation and the state.

Employment Composition

Following the nationwide trend, a significant amount of employment in the Coastal Bend WDA has shifted from manufacturing-oriented industries to service-oriented industries. Exhibit 3 provides a snapshot of employment composition in the region during 2008. The bar charts are organized by employment according to the 2-digit NAICS classification of “supersectors.” The data for 2003 are also shown for comparison.

The Coastal Bend regional economy is represented by a diverse mix of industries. According to the data, the “education and health services” sector accounts for the largest amount of jobs in the Area, followed by the “trade, transportation and utilities” and “leisure and hospitality” sectors. The largest sector is responsible for over one in four jobs in the Area. However, the share of employment in education and health services combined reduced from 2003 to 2008. Similarly, the shares of employment in manufacturing and service sectors declined over that same period while the shares of employment in other sectors, particularly construction and natural resources, expanded.

The “information” sector, which includes telecommunication and software publishing, is the smallest sector by employment (2%). While the share of employment in the information sector is equally small at the state and national levels, the number of local jobs in this sector actually declined between 2003 and 2008.

Employment concentrations across the broad sectors reflect the make-up of the economic base in the regional community. For example, oil and gas extraction and other petrochemical related industries are reflected in the sector of natural resources and mining; and the military bases in Corpus Christi, Ingleside and Kingsville account for many public administration jobs.
**Exhibit 3**
Employment Composition by Sector.

As compared to Exhibit 3, Exhibit 4 provides a slightly different perspective of the regional economic base in the form of composition by output instead of employment. Total output in the Coastal Bend WDA is the value of production using the Area’s own resources, such as land, labor and capital.\(^1\) As the pie chart in Exhibit 4 indicates, the output share is greater than the employment share for some sectors but smaller for other sectors. In particular, the output shares of natural resources and mining, manufacturing and financial services sectors at least double their employment shares. This means that workers in those broad sectors are much more productive, i.e., more output per worker, than workers in other sectors.

Businesses typically compensate their employees for their productivity and skills. For this reason, the discrepancy between output and employment compositions can be appreciated by comparing wage earnings across industries. Exhibit 5 lists the average hourly wages for the 2-digit NAICS broad sectors. In comparison with the regional average of $16.2, hourly wages in 2008 varied widely from less than $7 in the “leisure and hospitality” sector to around $25 in the “natural resources and mining” and “manufacturing” sectors. Wages tend to be higher for industries within a sector where its output share is higher than its employment share (e.g., mining, manufacturing and financial services). Conversely, wages tend to be lower in sectors with a lower output share than employment share (e.g., accommodation and food services).

The employment data presented above provide a snapshot of the relative strengths of different industries in the Coastal Bend WDA. However, to better understand the economic roles of those industries, industry cluster analysis should also take into account other measurement factors, such as output and wages.

---

\(^1\) Output at the national level is most commonly measured by Gross Domestic Product. The equivalent measure at the regional level is Gross Regional Product. These measures are also called value added.

II.  INDUSTRY CLUSTER ANALYSIS

Methodology  

Industry Cluster Definition

An industry or sector is a group of businesses that supply similar products or services. The NAICS, which has replaced the SIC since 1997, provides guidelines for identifying most industries in the U.S.

Industry clusters, in contrast, resist easy definition. According to the Texas Workforce Commission (2005), an industry cluster is “a concentration of businesses and industries in a geographic region that are interconnected by the markets they serve, the products they produce, their suppliers, the trade associations to which their employees belong, and the educational institutions from which their employees or prospective employees receive training.” By comparison, Porter (1990) describes an industry cluster as a group of interrelated businesses or industries with strong vertical and/or horizontal linkages. Vertical linkages are made up of buyer-seller relationships between businesses. Horizontal linkages develop when businesses share a common market for their products, or specialized infrastructure, distribution channels or resource inputs, such as labor skills and technologies.

An industry cluster, in some cases, may be synonymous with a broad industry sector. However, the definition of a cluster demands a higher level of detail than the standard classification by the SIC or NAICS system (e.g., manufacturing, trade, and mining). Cluster analysis groups businesses according to their final products and how these products are related to each other or integrated along the vertical supply chain. This approach provides a more meaningful view toward industries than the official classification method based solely on the similarities of final products or services.

Industry Cluster Analysis

Industry cluster analysis is an exploratory method that organizes observed data into meaningful economic groups, or industry clusters. The objective is to establish a set of clusters such that the degree of association or similarity between members of the same cluster is stronger than members outside the cluster.

The particular approach of industry cluster analysis used in this study is agglomerative. This approach initially treats all individual data or industry segments as clusters. They are subsequently fused together, forming larger and larger clusters. Exhibit 6 illustrates a convenient way to visualize industry clusters, namely A, B and C, using two criteria on the two axes, one of which represents the characteristics of labor skills and another one represents the characteristics of products.
Exhibit 6
Hypothetical Industry Clusters.

[Diagram showing three clusters labeled A, B, and C, plotted on a graph with axes labeled Labor skills and Product characteristics]
Location Quotients

One common approach in identifying industry clusters is based on quantitative techniques, such as location quotients and shift-share ratios. These two techniques underscore those areas of a regional economy in which comparative advantages exist. An industry is considered to possess a comparative advantage if its employment, output, productivity or growth is high relative to other regions. One way to identify the industries that perform relatively better than others is to compute location quotients.

A location quotient (LQ) is a measure of an industry’s concentration within a region relative to a benchmark, such as the nation or state. A location quotient is computed as the ratio of an industry’s share of local employment over that industry’s share of national or state employment. Using the U.S. as the benchmark, then the formula for calculating the location quotient of Industry X in a particular area can be expressed as follows:

\[
LQ \text{ of Industry X} = \frac{\text{Employment in Industry X in the Area}}{\text{Employment in Industry X in the U.S.}} \div \frac{\text{Total Employment in the Area}}{\text{Total Employment in the U.S.}}
\]

The estimate based on the above formula is also referred to as a coefficient of specialization. If a location quotient is greater than 1.0, then it indicates that the industry has a larger concentration of employment within the region than employment in the same industry for the nation as a whole. That particular local industry is also a likely source of local exports outside the region, and this is also called an “export” industry. Conversely, if a location quotient is less than 1.0, then the industry is not well represented in the region, and a relatively large portion of the goods or services represented by that industry is likely imported from the rest of the world. Some industries are inherently local, such as real estate and dry cleaning. Since the goods or services of these industries are neither exported nor imported, their local quotients are typically close to 1.0. A value of 1.0 indicates an equal share of local employment in the industry between the regional and national economies.

The long-term growth of a regional economy has commonly been described in terms of growth in “export” industries. These industries typically export their goods or services outside the region, supporting “ancillary” industries, such as retail, housing and personal services. Those export-oriented industries are important because exports generate income to pay for imports and support local economic activity. Location quotients help identify these industries.
In essence, location quotients provide a description of the regional economic base by highlighting the comparative advantages of a region. They are, nevertheless, static measures and tell little about the growth (dynamic) patterns of regional industries. As shown below, for example, the location quotients for oil and gas related industries in the Coastal Bend WDA are relatively high, but their employment has in fact declined over time.

**Shift-Share Analysis**

Shift-share analysis is another analytical tool to account for the competitiveness of a region’s industries. This approach essentially provides an account of the growth differential of a particular industry in that region and in the nation or state. A shift-share ratio is simply the ratio of percentage employment growth of an industry in a region during a given time period over the percentage change in employment of that industry in the nation or the state during the same period. In this study, the shift-share analysis is applied to historical employment data over the 2003-2008 period as well as projected employment data over the 2008-2018 period. The findings provide insights into the potential strengths of regional industries as a result of shifting industry shares over time not only in the past but also in the future.

By revealing the relative presence of different industries in a region, the estimates of location quotients and shift-share ratios will provide an initial understanding of potential industry clusters. These quantitative analyses, however, do not necessarily address whether relationships actually exist among individual firms, nor do they account for other factors beyond the product-market relationship, such as industry collaboration and information flow. For this reason, the quantitative findings will be supplemented with qualitative analysis, such as identifying commonalties between industries (e.g., workforce or infrastructure needs, or technologies used).
Results of Economic Base Analysis

Exhibit 7 displays the estimates of location quotients and shift-share ratios for a list of economic sectors based on the 2- and 3-digit NAICS definitions. Because some 2-digit-level "supersectors" (e.g., education and health services) are too broad to be informative about the industrial make-up of the regional economy, analyses are performed for the 3-digit level of NAICS industries. The findings are based on comparing regional employment data against the data of the state of Texas.

The second to fourth columns in the table list the location quotients for the three reference years of 2003, 2008 and 2018. Location quotients or shift-share ratios greater than 1.1 are highlighted in **bold** and *italic*. An estimate greater than 1.1 indicates that the industry is 10 percent or more over-represented in the Coastal Bend WDA compared with the state as the benchmark. The location quotient estimates in the table indicate employment concentrations in a wide array of sectors in addition to the public sector: natural resources and mining; construction; education; health services; and leisure and hospitality sectors. The estimates are comparable across the three reference years. In particular, the results confirm that the overall make-up of the regional economic base has remained about the same since 2003—the observation period of the previous report in Lee (2004).

The fifth and sixth columns in the table list estimates of shift-share ratios for the 2003-08 and 2008-18 periods, respectively. A shift-share ratio greater than 1.1 indicates that the Coastal Bend WDA is projected to add 10 percent more jobs in an industry over a given period than the percentage of job gain in that industry within Texas. At first glance, the table suggests that only the “natural resources and mining” sector experienced significantly higher employment growth in the region than in the state over the 2003-08 period. This shift-share measure is misleading, however, as the positive ratio is actually the outcome of negative job growth in mining at both local and national levels. About half of the sectors have experienced relatively less employment growth in the region than in the state as a whole. Between 2008 and 2018, employment growth of most industries in the region appears to stay behind the corresponding industries in the state as a whole. The relatively slow regional employment growth is attributable to the adverse economic impact of the 2005 BRAC decision, which has led to the closing and realignment of the major military bases in the region.

In addition to the numerical data in Exhibit 7, Exhibit 8 provides a graphical illustration of how the economic sectors perform by plotting their location quotients against their growth differentials with the state of Texas. The bubble sizes represent the sizes of employment. In principle, a bubble that is farther away from the origin and closer to the upper-right corner represents better performance—the industry not only witnesses a relatively higher employment concentration in the region than in the nation as a whole, but that industry is also expected to grow more rapidly. It is apparent that the mining sector outperforms all other sectors. Overall, Exhibit 8 reveals no clear winners at a broad sector level.

Exhibit 8
Performance of Sectors.

Sources: Texas Workforce Commission and author’s calculations.
As pointed out above, employment data offer only a partial view of the economic contribution of different industries to a region. Exhibit 9 compares the employment composition against the wage composition of different sectors. The total wages for a sector are its mean wage rate, as shown in Exhibit 5, multiplied by the total number of jobs in the sector. Because of varying wages, the shares of the sectors differ between the two pie charts. The sectors that have higher wage shares than employment shares generate more high-paying jobs—mining, construction and manufacturing. The sectors that have lower wage shares than employment shares generate more low-paying jobs—retail trade and food services. These findings are helpful in identifying the local industry clusters in the following section.
Exhibit 9
Comparison of Employment and Wages.

SOCRATES Analysis

While the shift-share analysis of broad economic sectors provides an overview of the relative strengths of the regional economic base, certain industry segments may perform differently from the broader sector to which they belong. This may occur if employment growth in one segment of a particular sector is offset by employment decline in another segment of that same sector. Exhibit 10 shows the corresponding results of the shift-share analysis based on the more detailed 3-digit NAICS classification. The shift-share analysis was performed using the Texas Workforce Commission’s SOCRATES online program. The SOCRATES shift-share analysis divides the change in regional industry employment into three factors: national growth, industrial mix, and regional shift.

The column labeled “National Growth Share” displays the share of local job growth that is attributed to growth of the national economy. In other words, it is the number of jobs lost or gained in the Coastal Bend WDA if total employment in the region had changed at the same rate as overall total national employment. If the U.S. as a whole experiences employment growth, then total national growth would likely yield a positive growth effect on the local economy.

The column labeled “Industrial Mix” shows the share of local job growth that is attributed to the area’s mix of industries under investigation. This second factor of local job growth isolates the fact that in the nation as a whole, some industries grow faster or slower than others. An estimate of the industrial mix factor represents the change in a local industry that is attributable to the change of the industry nationally.

The column labeled “Local Share” displays the share of local job growth as a result of unique regional factors that cause growth or decline in regional employment of a particular industry. This factor reflects some comparative advantage in the region, such as natural resources and labor costs and location.

The SOCRATES shift-share program also identifies industries into three groups: industries with the “greatest likelihood for potential job opportunities,” industries with “potential comparative advantage,” and industries that are “less likely to offer employment opportunities.” In principle, industries with both a high industry mix effect and a high local share will be the industries with the greatest likelihood for potential job opportunities.

Exhibit 10 shows the results of the SOCRATES shift-share analysis for the period 2003-08. The panel under the label of “Greatest Likelihood for Potential Job Opportunities” lists those local industries that exhibited high employment potential between 2003 and 2008. Food Services and Drinking Places (NAICS 722) showed the largest change in absolute employment with a gain of 2,631. Specialty Trade Contractors (NAICS 238) followed with a gain of 1,714 jobs. Heavy and Civil Engineering Construction (NAICS 237) followed closely in absolute employment change with a gain of 1,411, followed by General Merchandise Stores (NAICS 452)
with 895 and Oil and Gas Extraction (NAICS 211) with 586. Industries that are also found to be significant for the Coastal Bend region during this time period were Building Material and Garden Supply Stores (NAICS 444), Management of Companies (NAICS 551), Health and Personal Care Stores (NAICS 446), Mining (except Oil and Gas) (NAICS 212), Electronics and Appliance Stores (NAICS 443), Waste Management and Remediation Services (NAICS 562), Agriculture and Forestry Support Activities (NAICS 115), and Museums, Parks and Historical Sites (NAICS 712).

The group of industries in the panel under the title of “Potential Comparative Advantage” represent those that show a positive local share with a negative industrial mix between 2003 and 2008. This is an indication that the Coastal Bend region may have some comparative advantage in these industries, despite declining national performance.

Identifying Industry Clusters

The industry cluster analysis in this study began with exploring candidates for industry “clusters” based on industries that demonstrate strengths in the Coastal Bend regional economy. The location quotient and shift-share analyses in the preceding section suggest that the Coastal Bend regional economy is driven by the following five broad industry clusters in the private sector: construction, energy, education, healthcare, and tourism. All but the energy sector are listed in the previous industry cluster study (Lee 2004). This study ignores the government sector, especially the military sector. Although the military bases in the region are filled with highly paid and skilled personnel, federal instead of local government agencies have much control over their employment conditions.

Exhibit 11 lists the industry segments included in each of the five clusters. Three of these five clusters are in line with the NAICS 2-digit sector definitions: construction, education, and healthcare. The construction cluster (NAICS 23) includes special trade contractors besides various construction services. Its combined employment accounted for about 6 percent of the regional total employment in 2008. This share of employment is expected to remain about the same in 2018. A significant portion of local construction activity is directly tied to industries in the energy cluster, particularly the oil refineries. The education cluster (NAICS 61) consists of elementary and secondary schools, colleges and universities, and other educational services. Employment in this cluster accounted for about 10 percent of the regional total in 2008 and the employment share will remain about the same in 2018. Healthcare is the largest cluster by employment. The healthcare cluster includes three industry segments of health services: offices of health practitioners, hospitals, and nursing and residential care facilities (NAICS 621-623). Employment in this cluster accounted for 11 percent of the regional total in 2008, and the employment share is expected to rise to 13 percent by 2018.

The other two clusters—energy and tourism—involve industries of more than one NAICS sector. The energy cluster is comprised of firms with vertical or horizontal relationships. For example, vertical relationships occur between firms in oil and gas extraction (mining sector), pipeline and water transportation (transportation sector), petroleum refining and petrochemical manufacturing (manufacturing sector), and petrochemical wholesalers (trade sector). Horizontal relationships develop when many of these business establishments are clustered together geographically, e.g., northern part of Corpus Christi. The Corpus Christi Port Authority, which facilitates the supply chain of the oil and petrochemical production processes with its deep-water port, also plays a vital role in this cluster. In the previous industry cluster study by Lee (2004), a similar cluster is limited to petrochemical-related firms. Given the recent growth of electric power generation in the Coastal Bend region, a broader cluster of energy-related firms has developed as an extension to original petrochemical cluster. Together, these energy-related industries accounted for about 6 percent of total regional employment in 2008.

---

2 Petroleum retailers, such as gas stations, are excluded because of their remote connections with the suppliers and their performance is affected largely by demand conditions rather than industry supply conditions.

Sources: Texas Workforce Commission and author’s calculations.
The tourism cluster is largely made up of industries in three 2-digit NAICS sectors: transportation (NAICS 84); arts, entertainment and recreation (NAICS 71); and accommodation and food services (NAICS 72). This cluster is synonymous with hospitality, which is also facilitated by air and local transportation, and travel agencies in the transportation sector. Together, the various industries in the tourism cluster, from hotel and motel accommodation to eating and drinking places to taxicabs, accounted for over 10 percent of regional employment in 2008 and the total employment share is expected rise slightly by 2018.

The five major industry clusters are made up of a wide array of industries across the Coastal Bend regional economy. Together, these clusters accounted for 45 percent of total employment in the Coastal Bend WDA during 2008. Between 2008 and 2018, the clusters are expected to gain a total of 26,000 jobs, or about 60 percent of the projected total employment growth in the region.

Within those five clusters, the industries that are expected to witness the largest numbers of job growth are: Support Activities for Mining (NAICS 2131) in the energy cluster; Elementary and Secondary Schools (NAICS 6111) in the education cluster; Home Healthcare Services (NAICS 6216) and General Medical Services (NAICS 6221) in the healthcare cluster; and Restaurants (NAICS 7221-7222) in the tourism cluster. On the other hand, some industry segments (e.g., Pipeline Transportation of Natural Gas and Chemical Manufacturing) in the energy cluster are expected to experience declines in employment.
III. DETAILS OF INDUSTRY CLUSTERS

Major Employers

Other than the number of jobs, the economic role of the identified industry clusters can also be appreciated by looking at the number of employers and establishments involved in those clusters. The primary source for employers is Texas Workforce Commission’s SOCRATES database, which is supplemented by the Small Business Finder at Hoover’s online website.

Exhibit 12 lists the number of employers (with at least 5 employees) in each of the 4-digit NAICS industry segments included in the clusters. The total number of firms (regardless of size) is 3,569, or approximately 40 percent of all firms in the Coastal Bend WDA. The clusters’ total firm share in the region is close to their total employment share. Physician Offices in the healthcare cluster top the list, followed by Restaurants in the tourism cluster.

Firms, of course, do vary in size. Exhibit 13 displays a short list of the largest regional employers in the clusters. The majority of the employers are located in the Nueces County. The largest representation is the education cluster, which has seven employers, followed by the energy cluster with five large employers. The list also contains large employers in the other three clusters. Most employers in the tourism cluster are relatively small. Appendix A contains a comprehensive list of local employers and their key business details such as sales volumes and relevant NAICS Codes.

Occupations and Wage Earnings

For workforce development purposes, it is important to identify the specific occupations within industries, particularly those in the five identified clusters. Most industries or businesses are supported by a wide variety of occupations, ranging from management to clerical to janitorial types of employment. Some occupations, on the contrary, are unique to specific industries, e.g., civil engineers and roofers in construction. Appendix B describes the staffing patterns with specific occupations in each of the industry segments in the five industry clusters.

Exhibit 12 also shows the average hourly wage rates for occupations in the five industry clusters. The average hourly wage rate across all industries in the Coastal Bend WDA was $16.20 in 2008. The energy cluster generated the highest wages on average at $38.88. Conversely, the tourism cluster yielded the lowest wages on average at $6.74.3 Of course, different occupations within the same industry pay differently. Across different industries, management positions tend to pay more than any other line of work.

---

Potential of Clusters as Industry Targets

According to Porter (1990), industry clusters are keys to regional economic growth in the long run. For this reason, many government agencies, including the state of Texas, have implemented policies targeting clusters that demonstrate competitive advantages or growth potentials. This section evaluates the five identified industry clusters as possible “targets” for economic and workforce development in the Coastal Bend WDA. Exhibit 14 summarizes the major strengths and weaknesses of those clusters.

Construction

The construction industry experienced unprecedented growth until 2008, when the housing bubble began to collapse across the U.S. Government projects as well as residential and commercial construction booms have spurred job growth in construction. Some long-term strengths of the construction industry are: (1) the industry has a mix of occupational skills—some occupations require formal training, e.g., civil engineers, while others require no training at all, e.g., laborers; and (2) wages are relatively higher than those in many other industries. The construction industry’s major weaknesses include: (1) construction is essentially an auxiliary industry that serves local demands; and (2) since much of construction activity is non-exporting, its performance is sensitive to regional economic conditions.

Energy

The energy cluster has long been considered as the mainstay of the Coastal Bend regional economy. Its strengths include the following: (1) The cluster consists of export-oriented industries with high employment concentrations relative to the rest of the nation; (2) many occupations in the cluster, e.g., chemical engineering, require professional degrees and thus pay relatively high wages and salaries; (3) many businesses and manufacturing plants in the cluster are interconnected as they are geographically concentrated alongside the Port of Corpus Christi; (4) the proximity to Houston, a major oil-producing metro area, helps facilitate shipping and manufacturing petrochemical products; (5) energy is also one of the industry targets adopted by the state of Texas since 2004 (Perry 2004); and (6) potential funding and other supports by the federal government, especially for alternative energy development.

Some weaknesses of the energy cluster are that: (1) the nationwide and statewide employment trends for some of its industries are declining; (2) industry performance is sensitive to world oil prices, which has been relatively volatile; and (3) concerns about environmental pollution from the petrochemical and power generation industries may instill future regulatory restrictions on those industries.
Exhibit 14
Strengths and Weaknesses of Industry Clusters.

CONSTRUCTION CLUSTER
Strengths:
- Relatively high wages
- Mix of occupational skills
Weaknesses:
- Non-export oriented industries
- Sensitive to regional economic conditions

ENERGY CLUSTER
Strengths:
- Export-oriented industries
- Occupations with high wages and skills
- Location advantages: geographical concentration, infrastructure support, and proximity to the Port and Houston
- Texas state industry cluster
- Federal government support
Weaknesses:
- Declining employment trends
- Sensitive to oil price movement
- Possible environmental impacts

HEALTHCARE CLUSTER
Strengths:
- Well established facilities
- Large numbers of occupations with high wages and skills
- Serves the needs of retirement communities and aging population
- Enhances the community’s quality of life
- Nursing school and other medical workforce training facilities in the region
Weaknesses:
- In competition with medical centers in Houston and San Antonio
- Lack of training programs for physicians

EDUCATION CLUSTER
Strengths:
- Complementary to other industries
- Growing workforce training programs at regional universities
Weaknesses:
- Non-export oriented industries
- Reliance on public funding

TOURISM CLUSTER
Strengths:
- Potential as top tourist destination with attractions
- Strong community support with major construction projects
- Enhances the community’s quality of life
Weaknesses:
- Mostly low-paying, low-skill jobs
- Geographical disadvantages
Education

The education cluster not only serves a basic need of communities in the Coastal Bend region, but it also plays an important economic role in the regional economy. About one in ten employees in the region works in education. Some economic strengths of this industry include: (1) schools and other educational facilities support other industries by providing skill training; and (2) the region’s universities and colleges offer teacher and other training programs for workforce in education.

The education cluster also faces the following potential challenges: (1) The area’s educational institutions serve mostly local residents and thus have a small export potential; and (2) the majority of these schools are public institutions so that their operations are constrained by public funding.

Healthcare

As the largest of the five industry clusters, the healthcare industry makes up over one-tenth of the regional economy. Its strengths include the following: (1) Hospitals and medical centers in the region have well established facilities; (2) large numbers of healthcare occupations with skill requirements offer relatively high wages; (3) there are growing healthcare needs from the retirement communities and the aging population in the region; (4) a sound healthcare system enhances the quality of life and the quality of workforce in local communities; and (5) workforce needs are met by the colleges and universities within the region (health service programs are offered by Del Mar College, College of Nursing at Texas A&M University-Corpus Christi, the School of Pharmacy at Texas A&M University-Kingsville, and Texas A&M University’s medical residency program at one of CHRISTUS Spohn’s hospital campuses).

There are also potential challenges in targeting the healthcare industry: (1) The region lacks a medical school for training physicians; and (2) major medical centers exist in neighboring metro areas, such as Houston and San Antonio, which may hinder the growth potential of this industry locally.

Tourism

As with the healthcare and education clusters, the tourism cluster employs about one in ten workers in the Coastal Bend WDA. The key strengths of this cluster include the following: (1) The Coastal Bend area and the Corpus Christi MSA, in particular, offer many tourist attractions to make the region a major visitor destination in Texas; (2) tourism has received strong support from the regional communities (e.g., the arena and baseball stadium under construction in downtown
Corpus Christi are considered tourism-enhancing projects); and (3) the industries in tourism, such as amusement and recreation, all tend to enhance local residents’ quality of life as well.

The tourism cluster, however, also has its drawbacks as a potential driver for regional economic growth: (1) Many jobs in this cluster require little or no skill and thus pay the least in wages among all industries; and (2) the area, particularly Corpus Christi, suffers some geographically disadvantages as a tourist destination, including the lack of direct air transportation to major hubs in the nation other than Dallas, Houston and Atlanta.

**Existing Target Industries**

As shown in Panel A of Exhibit 15, the state of Texas has officially adopted an economic development strategic plan that targets six industry clusters (Perry, 2004): advanced technologies and manufacturing; aerospace and defense; biotechnology and life sciences; information and computer technology; petroleum refining and chemical products; and energy. The comparative advantage of the Coastal Bend WDA has given rise to the development of the broad “energy” cluster that are consistent with the final two industry targets (petroleum refining and chemical products; and energy) at the state level.

At the regional level, Workforce Solutions of the Coastal Bend has regularly updated a list of target industries. Panel B of Exhibit 15 lists the 16 target industries for the 2009-10 period by 4-digit NAICS classification. The industry segments of the economic clusters in the present study match most of the target industries currently adopted by the regional workforce development board. The major exceptions are industries in the manufacturing sector (NAICS 3252-3366). All but two industries on the local list also coincide with the Texas State Governor’s target industries. The two exceptions are in construction (NAICS 2373, 2379), which reflects the particular comparative advantage of the Coastal Bend region. These two industries are also included in the broad “construction” cluster of the present study.

The main objective of this report is to identify those industries that generate economic growth to the regional community of the Coastal Bend WDA. For future development purposes, however, it is important to also nurture industries or develop occupations that are competitive in the global marketplace but remain in infancy locally. Advanced technologies and manufacturing, which have been adopted by the local workforce development board, are primary examples.

Source: Perry (2004); Workforce Solutions of the Coastal Bend, June 2009.
IV. FINAL OBSERVATIONS

The Coastal Bend WDA has a diverse mix of industries that contribute to regional economic growth—construction, energy, education, healthcare and tourism. Together, these five industry clusters account for nearly half of total employment in the region. Most firms in these industries are services as opposed to manufacturing oriented. The largest clusters are healthcare, education and tourism, each of which shares a roughly 10 percent of the regional workforce. The overall economic base that are represented by these major industry clusters has changed little since 2003—the observation year in the previous study for the region (Lee 2004).

Given the limited resources available for economic and workforce development, it is important that policymakers allocate these resources efficiently in order to meet the needs of established or potentially growing industries. This study has present findings of quantitative analyses to help identify those industries and aggregated them into clusters.

Industry clusters have increasingly been viewed as economic development focal points. With a better understanding of the leading economic drivers, policymakers should begin to learn about specific infrastructure and workforce needs for industries within these industries. On the other hand, they should not neglect other industries that are in infancy but have potential to grow.

Private enterprises form the core of industry clusters in the Coastal Bend WDA. Yet evidence across the U.S. indicates that clusters tend to be more successful through a network of supporting organizations, including government, civic organization and educational institutions, which help provide workforce training, consulting services, and so on. With hindsight, collaboration may be the next step of the development process.
